General Instructions

- 1. Each time a set of neurological observations are recorded; a complete set of vital signs (RR, SpO₂, BP, HR, T°, Consciousness) should be completed and recorded on the DANGERS observation chart.

THO-N 2006 04/14 F&P 39648 - APR14 M1

Determining Best Motor Response

Step 1

Ask the patient to 'obey a command' that requires a specific response, such as 'please wiggle the fingers of your LEFT hand'.

NB: Avoid asking patient just to squeeze your hand as a response may just represent reflex action.

If appropriate response is not seen, go to next step

Step 2

Rub one of the superior orbital margins (eyebrow) while applying firm pressure. Patients able to **localize** pain will respond by moving a hand above the chin.

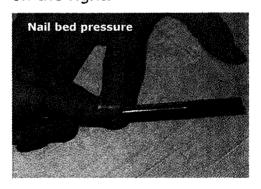

NB: Intoxicated patients will often require considerable and sustained stimuli.

If appropriate response is not seen, go to next step.

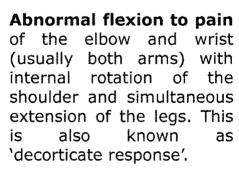

Step 3

Apply firm pressure to a fingernail bed and look for one of the responses shown on the right.

NB: Rubbing the sternum is not a good way to determine best motor response as it may not help to distinguish between 'localizing pain' and 'abnormal flexion'. It may also leave bruise marks.

Withdrawal from pain of the limb by flexion at the elbow and external rotation at the shoulder joint.

Abnormal extension to pain of (usually both) arms and legs. This is also known as 'decerebrate response').
